

Forward Deployed Engineer: Take-Home

The situation

Attached is an export of our account data: a CRM dump, per-account product usage logs, seat provisioning, and the team's call notes. It's synthetic, but it's as messy as production actually can be. Assume nothing about it is clean.

The ask:

"We have 50-some live accounts and no idea which ones are in trouble. Post-sales is running on nothing. Build me an example hub, with whatever tools you think we need in it. I should be able to open it and know where to spend my team's attention next week and next quarter."

What we'd like you to present

- 1. Whatever you built.** Hosted somewhere that we can open it. We care about how you got to the answer, and how you think about what to build.
- 2. A short readout.** Where would you point the team next week, where next quarter, and why, plus an explanation of the tools you have built. A page of notes is plenty. This is the part that tells us the hub is actually doing something.
- 3. Your cut list.** What you decided not to do, and why.

Ground rules

Tools. Use anything. AI assistants, any language, any stack. However you actually work is how we want to see you work.

Prioritize. Don't over-invest in any one piece. A defensible answer on rough plumbing beats perfect plumbing and no answer. Deciding what matters when nobody tells you is the actual job.

Ask if you're blocked on logistics. Judgment calls about the data are yours. Just tell us what you decided and why.

How we'll look at it

Roughly in this order:

1. Did you build the right tools? An open brief means the choice of what to build is yours, and it's the first thing we'll look at.
2. Did you find the real story in the data?
3. Does it work across all the accounts, not just the easy ones?
4. Does it run, and could someone else on the team pick it up and use it?
